1. Re-arrange array
2. Quick sort

Q. Given an $arr[n]$: re-arrange it such that

Bring last element to its correct sorted position:

All values $<$ last elem are continuously on leftside of last element

All values \geq last elem are continuously on rightside of last element

Note: Without extra space

0 1 2 3 4 5 6 7

Ex: $arr[8]$: 9 8 1 6 5 11 4 7

0 1 2 3 4 5 6 7

Ans1: $arr[8]$: 1 4 5 6 7 9 8 11

Ans2: $arr[8]$: 6 4 1 5 7 11 8 9

Ans3: $arr[8]$: 1 4 5 6 7 8 9 11

#Note: Multiple ans
are possible return
any one of them.

0 1 2 3 4 5 6 7

Ex2: $arr[9]$: 5 13 7 8 25 20 23 10

0 1 2 3 4 5 6 7

Ans1: $arr[8]$ = 7 5 8 10 25 20 23 13

Ans2: $arr[8]$ = 5 7 8 10 13 20 23 25

#Ideal: Sort arr)

1. Using BS/BS/BS TC: $O(N^2)$

2. Inbuilt/Merge TC: $O(N \log N)$

Idea 2:

Take 2 indices i & j

i : Iterate in array

j : To track swapping index

$arr[8]$:

0 1 2 3 4 5 6 7

last-element

9 8 1 8 5 11 6 7

$n=7$

1 6 9 8 9 8 ;

1 6 5 4 9 11 8 7

j

1 6 5 4 7 11 8 9

$arr[8]$:

0 1 2 3 4 5 6 7 8

$n=6$:

7 10 1 8 2 9 12 3 6

4 2 7 10 7 ;

4 2 3 8 10 9 12 7

j

4 2 3 6 10 9 12 7 8

obs:

if($arr[i] < n$) { swap arr[i] & arr[j]; j++ }

if $i == N-1$: { swap arr[i] & arr[j] }

int re-arrange (vector<int> &arr) { TC: $O(N)$ SC: $O(1)$

int N = arr.size();

int n = arr[N-1], j = 0;

for (int i = 0; i < N-1; i++) {

 if (arr[i] < n) { # arr[i] should come at left

 swap arr[i] & arr[j];

 } j++

 swap arr[N-1] & arr[j]; # Bringing last element to its correct pos

QuickSort Idea:

By Iteration TC:

Level 0

Iterations

N

\uparrow

Level 1

N

Level 2

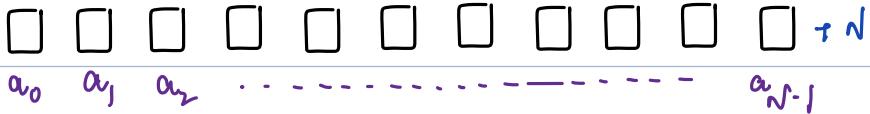

$\uparrow N$

Level 3

$\uparrow N$

Level $\log_2 N$

$a_0 \ a_1 \ a_2 \ \dots \ a_{N-1}$

$\uparrow N$

Note: for single element or empty elements we return, which will take $O(1)$, Doing it N Time: $O(N)$

Obs: At every level we will have N iterations.

Total no. of levels = $\log_2 N$

Total TC = $O(N \log_2 N)$

Ass: Given $arr[], s, e$: Sort $arr[]$ from $s..e$ & return nothing.

void Quicksort(vector<int> &arr, int s, int e) {
 if (s >= e) { return; }
 int n = arr[e], j = s;

Best Avg Worst

$O(N \log N)$ $O(N \log N)$ $O(N^2)$

SC: $O(\log N)$ $O(\log N)$ $O(N)$

#Step1: Bring last ele to its correct p.

```
int n = arr[e], j = s;  
for (int i = s; i < e; i++) {  
    if (arr[i] < n) {  
        swap(arr[i], arr[j]);  
        j++;  
    }  
}
```

$[s \ s+1 \ s+2 \ \dots \ e-1 \ e]$

$s \ \dots \ j-1 \ j \ j+1 \ \dots \ e$

$s \ \dots \ p-1 \ j \ p+1 \ \dots \ e$

swap $arr[e]$ & $arr[j]$;

Quicksort($arr, s, j-1$);

Quicksort($arr, j+1, e$);

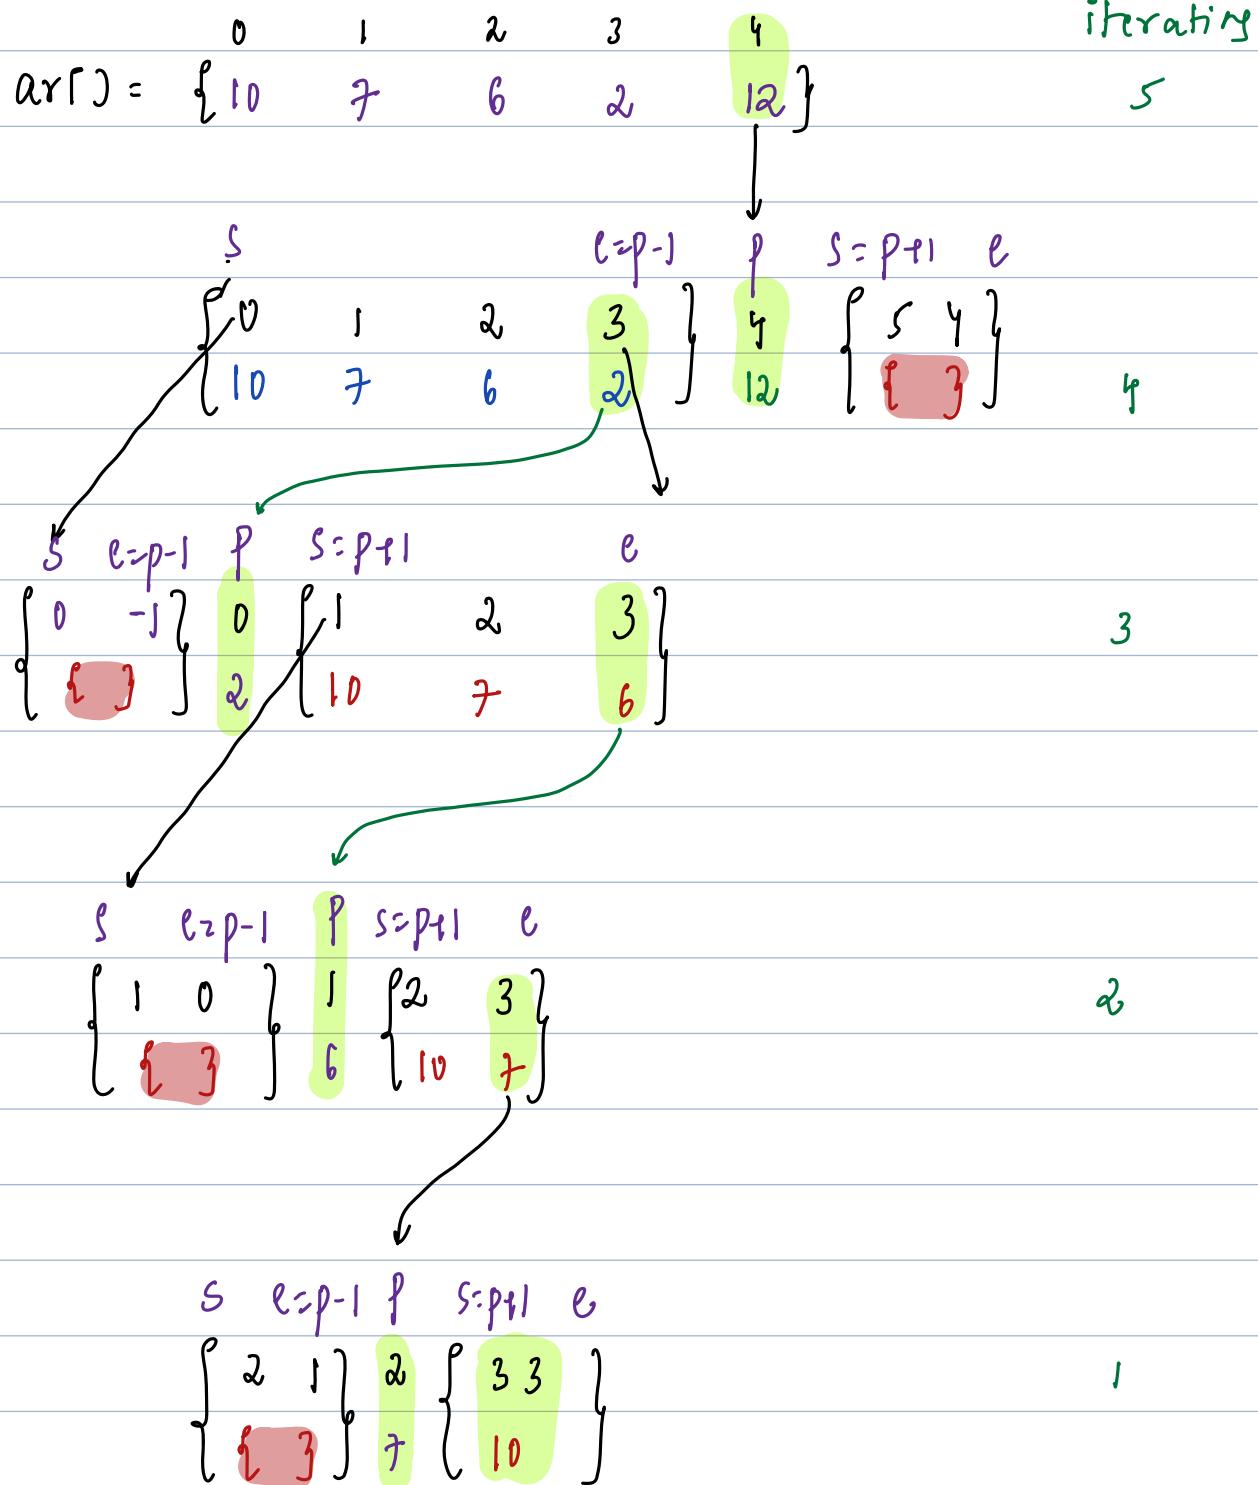

3

vector<int> solve(vector<int> &arr) {

```
int N = arr.size();  
Quicksort(arr, 0, N-1);
```

3

QuickSort: Worst Case:

#Con: In above example total iterations = 1+2+3+4+5 = 15

#Worst Case:

$$\text{Total Iterations} = 1+2+3+\dots+N-1+N = O(N^2)$$

Probability that above case occurs is less, hence we consider avg = $O(N \log N)$

~~Note: If~~ Time permits 1 more small question.
